

What this is, why we prepared it, and what it does not claim.

One page of orientation before any numbers. We built this from your public filings before contacting you, because a useful conversation should begin with evidence rather than a capability presentation.

MEDIAN OUTCOME, OUR COMPLETED WORK

\$8.7M

a year — \$5.5M on our weakest quartile

Not a published range. This is the **median outcome across 158 completed ERA engagements** in your own categories, applied to the \$43.7M your filing names. Of 2,660 engagements overall, **2,649 recovered value** — and the weakest quarter still returned 14%.

How it was built

Your public filing. Nineteen expense lines; seven map to categories we work.

A peer comparison. Each category against every nonprofit filer that breaks it out separately.

Our own completed work. What ERA has recovered in those categories — not a projection.

Reading the position

Above the median is a question, not a verdict. Your model is one reason a category sits high.

At or below it is not proof of competitive buying — the median is drawn from organizations that have mostly never tested either.

What we looked at, and what we did not

ERA works **55 indirect categories**. Your Form 990 reports **12 lines of indirect spend**, totalling **\$82.1M**. Here is every one of them.

	LINES	AMOUNT	WHAT WE DID, AND WHY
Modelled	2	\$40.6M	Operating supply and freight. We have 158 completed engagements in these two, so the figure above is a median outcome rather than a range.
Additional, to be quantified	3	\$3.1M	Fleet, marketing and travel — all categories we work. We hold fewer than 15 completed engagements in each, so rather than quote a median we would rather size these against your own data. Upside to the figure above, not part of it.
Additional, needs your detail	7	\$38.5M	Chiefly occupancy at \$24.4M. We work everything in that line except the rent — utilities, maintenance, janitorial, grounds, security — but a Form 990 reports them as one figure. Thirty seconds of your own ledger splits it. Also upside.

The **\$8.7M above comes only from the first row**. The other \$41.6M is real indirect spend in categories we work — we have simply chosen not to put a number on it from a public filing. It is sized in the no-cost baseline, against your contract data rather than ours. Nothing has been left out, and nothing has been assumed.
